

# Mobility is Resource Optimization

Maintain and manage work requests, work orders, preventive maintenance, corrective maintenance, work order history, maintenance & safety instructions and observations in your handheld and then synchronize all this data back to CMMS/EAM system.

Manage and optimize the performance your assets and equipment through service automation

## WORK REQUESTS

Technicians can generate a work request after spotting a problem/abnormality in the asset, facility or location which is in need of any maintenance activity. Mobile CMMS automates the process by giving the technician a set of drop-down asset/location lists which enables them to raise a quick online work request.

## WORK ORDER TRACKING

Work order tracking is used to create new work orders based on the work request or a preventive maintenance program and also to update existing work orders. Supervisors can view the status and various resource requirements of the work orders. Resources include labor, Materials, Spares, Tools etc.

## SCHEDULED ASSET AUDITS

Pre-scheduled asset audits serve multiple purposes, such as verifying asset locations and internal equipment control numbers, and to perform important condition monitoring during an audit.

## WORK ORDER RESOURCES - PLANNED AND ACTUALS

Record actual Labor Hours, Materials Consumption and Tools Consumption against the work order plan. Users are able to view the planned quantity/cost vs. actual quantity/cost. Variance list can be created for inventory adjustment.

## FAILURE REPORTING

Failure reporting is used to enter the failure codes, problem, cause, and remedy for a particular work order. They can be used on a work order for any type of asset. Failure codes provide a convenient method of getting statistics about equipment failures or breakdowns.

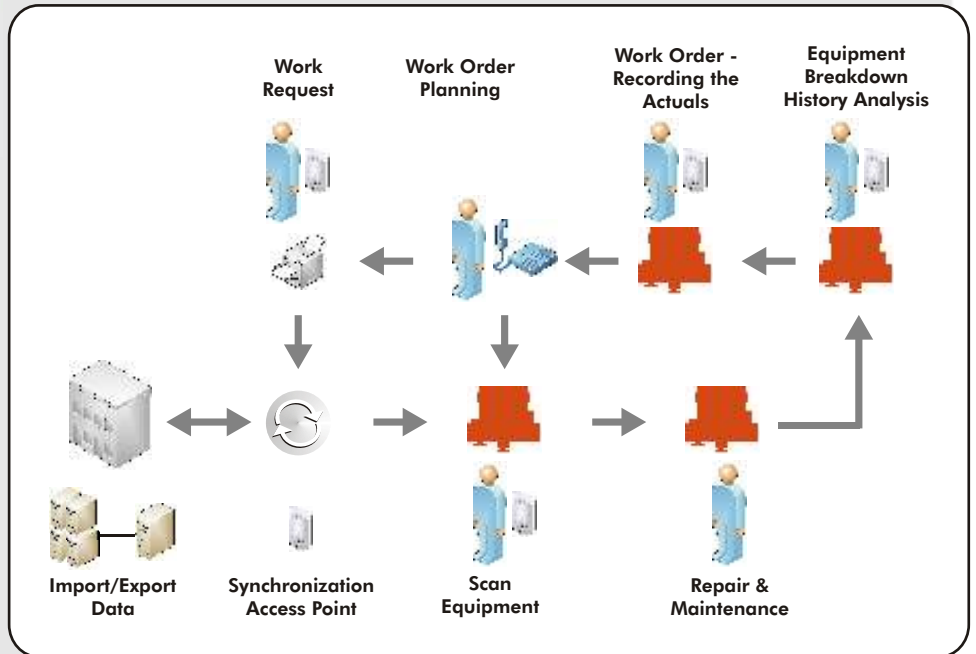

## ROUTE LISTS AND STOPS

Being able to locate what equipment is to be tested based on a route list so that equipment can be tested in a sequence that affords the most economical utilization of effort. Define and manage Routes, and Route Sequences.

## FEATURES

- Ability to approve or reject work requests
- Equipment Master
- Labor time sheet
- Measurement Points and Meter Readings
- Track and manage Inspection logs
- Job Assignments
- Work Order Operation Steps
- Safety Hazards & Precautions
- Work History by Equipment or Location
- Location Hierarchy Look-ups

## BENEFITS

- Boost productivity, reduce costs, improve labor management to protect and extend the life of vital assets.
- Eliminate paperwork  
Lets technicians spend more time working on equipment freeing them from paperwork and data entry
- Increase Productivity  
Bring existing CMMS to the point of performance. To provide mobile access to equipment repair history and job plans, making your technicians assignments more efficient
- Improve Data Collection  
Increase the quantity and accuracy of data collected in the field
- Operational optimization  
By eliminating paperwork and costly, time-consuming data entry, Mobile CMMS lets technicians spend more time on equipment improving plant uptime, production levels and customer service.
- Real-time evaluation of plant conditions.
- More accurate time capture for customer billing, and allocation of materials and labor costs
- Elimination of duplicate and/or redundant data entries for the
